

IN THE ABSTRACT

--- A method ~~of a~~ for pre-recognition processing ~~is proposed for~~ of forms with non-fixed fields layout. One or more objects[,] that are present on ~~[[the]]~~ a form ~~[[and]]~~ can be reliably identified after conversion of the form into an electronic state[,] . Objects are preliminarily assigned to act as reference points for spatial binding of data input fields or groups thereof. In the case of a text object as a reference point, ~~[[the]]~~ text recognition is additionally performed. The spatial location of ~~[[the]]~~ a reference point may be not fixed. ~~[[The]]~~ A reference point may be described as alternative. ~~The field~~ Field identification may be performed either automatically or manually.---
